See the difference correcting cataracts and astigmatism can make

What you may see without glasses after you correct your cataracts

What you may see without glasses after you correct cataracts and astigmatism together

The simulated images above are for illustration purposes only.

About 1 in 3 people have corneal astigmatism, which is a normal condition that may produce blurry vision
Intraocular Lens Implants for Astigmatism

**AcrySof® IQ TORIC: Important Product Information**

**INDICATIONS:** The AcrySof® IQ TORIC lenses are intended to be placed in the capsular bag. AcrySof® IQ TORIC Posterior Chamber Intraocular Lens (IOL) is intended for patients with pre-existing corneal astigmatism with or without presbyopia, who desire improved uncorrected distance vision, reduction of residual refractive cylinder and increased spectacle independence for distance vision.

**WARNINGS:** Careful preoperative evaluation and sound clinical judgment should be used by the surgeon to decide the risk/benefit ratio before implanting a lens in a patient with any of the conditions described in the Directions for Use labeling. Some adverse reactions that have been associated with the implantation of intraocular lenses are: hypopyon, intraocular infection, acute corneal decompensation, muscular cilia, pupillary block, retinal detachment, and secondary surgical intervention including but not limited to lens repositioning, biometry error, visual disturbances or patient dissatisfaction. Careful should be used prior to lens encapsulation to avoid lens disorientation or dislocations. AcrySof® IQ TORIC lenses should not be implanted if the posterior capsule is ruptured, if the capsule is damaged, or if a primary posterior capsulotomy is planned. Rotation can reduce astigmatic correction. If necessary, lens repositioning should occur as soon as possible prior to lens encapsulation. All viscoelastics should be removed from both the anterior and posterior sides of the lens, residual viscoelastics may cause complications including lens instability.

**PRECAUTIONS:** Do not resterilize. Do not store over 45°C. Use only sterile irrigating solutions such as BSS® or BSS® PLUS. Similar intraocular irrigating solutions. Studies have shown that color vision discrimination is not adversely affected in individuals with the AcrySof® Natural IOL and normal color vision. The effect on vision of the AcrySof® Natural IOL in subjects with hereditary color vision defects and acquired color vision defects secondary to ocular disease (e.g., glaucoma, diabetic retinopathy, chronic anemia, and other retinal or optic nerve diseases) has not been studied. In a previous study, posterior capsule opacification (PCO), when present, was recognized earlier as clinically significant PCD with the AcrySof® IQ TORIC lenses as compared to the monofocal control.

**ATTENTION:** Reference the Physician labeling/Directions for Use for a complete list of indications, warnings and precautions. The long-term effects of filtering blue light and the clinical efficacy of that filtering on the retina have not been conclusively established.
